

ADD-ON FOR GNSS ANTENNA

Description of an add-on for a GNSS receiver

Technological benefits

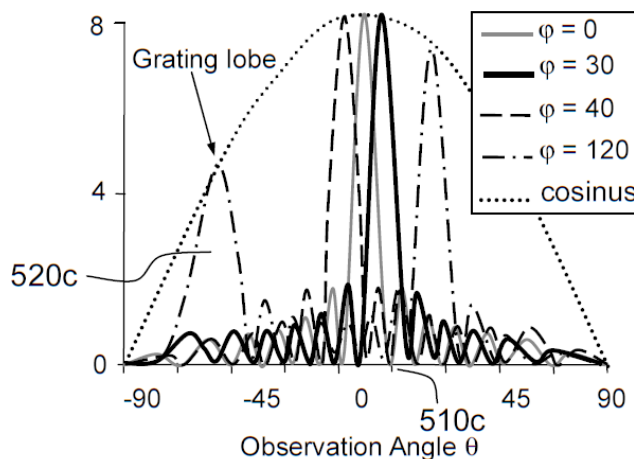

Improved robustness for GNSS receivers in terms of multipath reflections

The invention is able to alleviate multipath reflections in order to limit their impact on receiver processing.

Interoperability of the device in terms of GNSS receivers

Enables greater GNSS positioning precision

The invention therefore improves calculation of the positioning.

© CNES

Invention overview

The invention proposes a device to be positioned close to a GNSS receiver that will allow wave reflections caused by different obstacles to be alleviated. It thus allows a more accurate calculation of GNSS positioning.

Commercial benefits

Interoperability of the system in terms of GNSS receivers

Potential applications

Improvement of all types of GNSS receiver
Interoperable invention
